Revised 08/2021

What you need to know about Carbon Monoxide

Carbon monoxide (CO) is a colorless, odorless, and poisonous gas. It is produced by the incomplete burning of fuel such as natural gas, gasoline, kerosene, oil, wood, or charcoal. CO decreases the ability of the red blood cells to carry oxygen throughout the body and decreases the use of oxygen by the cells. If a person breathes in CO for a long period of time or at a high concentration, it can kill them.

Signs and symptoms of carbon monoxide poisoning are:

- Dizziness
- Headache
- Tiredness
- Vomiting
- Confusion
- Fainting
- Seizures
- Coma
- Effects on the heart

Notice that many of these signs and symptoms mimic the flu!

Common sources of carbon monoxide in and around the home:

- Gas and oil furnaces
- Gas and charcoal grills
- Portable generators and heaters
- Cars, trucks, and vans
- Gas and oil hot water heaters
- Lawnmowers, trimmers, and leaf blowers
- Gas stoves
- Gas clothes dryer
- Fireplaces and wood stoves
- House and structure fires
- Some paint strippers

To prevent unintentional carbon monoxide poisoning:

- Install carbon monoxide alarms.
- Have gas and oil burning appliances checked yearly at the beginning of the heating season.
- Portable Check to see that the pilot light on gas burning appliances is lit (blue flame).
- Use generators outside more than 20 feet away from windows and doors.
- Do not use the oven to heat your home.
- Do not use portable heaters while you are sleeping.
- Do not use charcoal or gas grills in the house, garage, or tent.
- Do not let the car run while in the garage (even if the garage door is open).

What to do in an emergency:

- Call the Maryland Poison Center.
- Remove all people and pets from the area.
- Turn off the suspected source of carbon monoxide and have appliance checked before using it again.
